

**Circulation Loop-1**

The first floor is mainly organized as two parts: one is the front of the house, the other the back. Each part is a fluid loop-space surrounding service/storage cores of various sizes and shapes. The front loop includes lobby, entrance courtyard, souvenir shop, cafeteria, etc. and their affiliated logistics space. The back loop includes exhibition preparation, workshop, staff office, storage, plant space, etc. Each core here has their own specific function for serving the surrounding space or upper floor. Such program logic will provide open and smooth space for the ground, while keep the service/storage space inside the dark cores of the first floor.
